

Tabakprävention und Covid-19

Prof Isabella Sudano, MD, PhD

University Heart Center, Cardiology,
University Hospital and University of Zürich

Covid 19 und Lungen

HOW COVID-19 KILLS

Acute Respiratory Distress Syndrome (ARDS) is a lung disease triggered by COVID-19. For people with ARDS, lungs fill with fluid, breathing becomes impossible and oxygen levels plunge. The only cure is time: artificially breathing for the patient until the inflammatory fluid subsides.

Vaping-associated lung injury

Tabak, Nikotin und Infekte

A

Tabak, Nikotin und Infekte

Large epidemiologic studies support the association between smoking and the prevalence of colds and lower respiratory tract symptoms.

Several studies have confirmed the relationship between cigarette smoking and the risk of influenza infections. Influenza infections are more severe, with more cough, acute and chronic phlegm production, breathlessness, and wheezing in smokers.

Arcavi L and Benowitz N. Arch Intern Med. 2004;164:2206-2216

Table 2. Severity of Influenza, According to Smoking Status.*

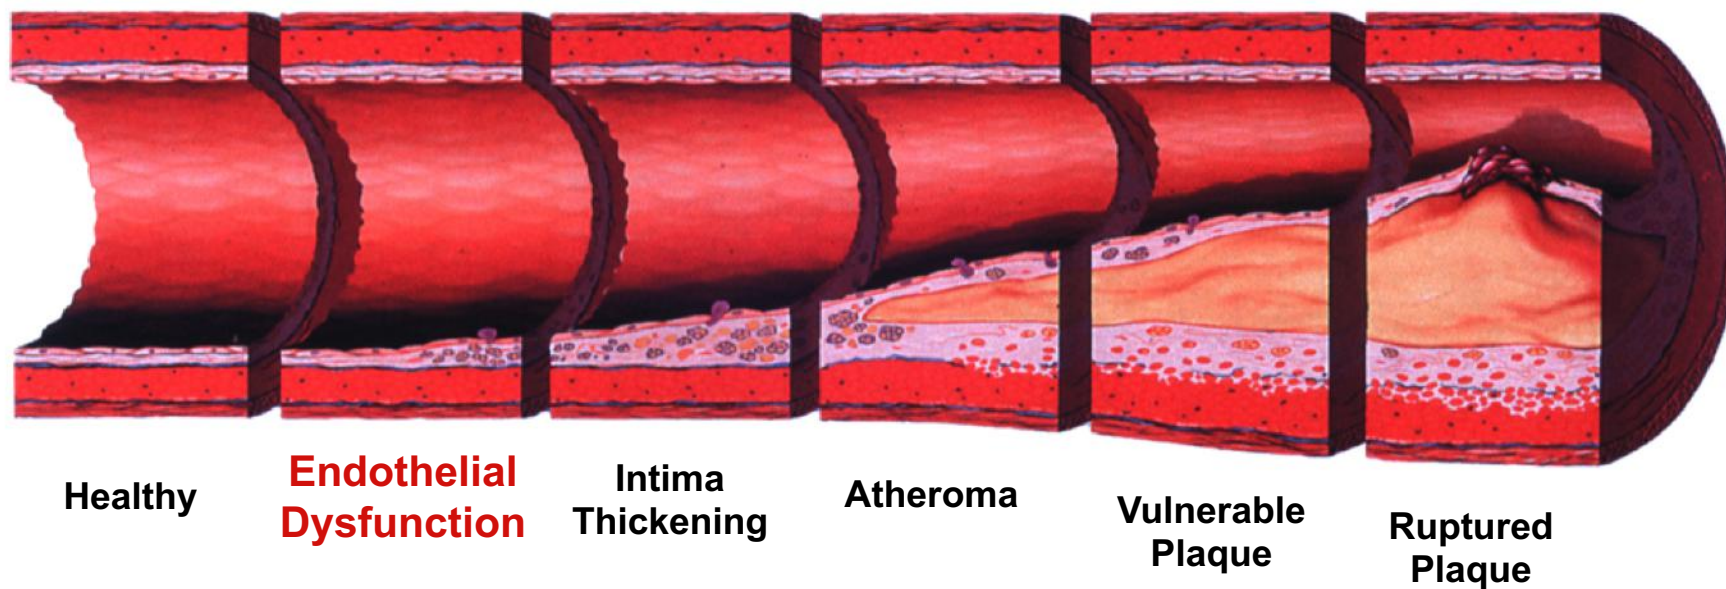

SEVERITY OF INFLUENZA	NONSMOKERS	SMOKERS	ALL SUBJECTS	ODDS RATIO
	<i>no. (%)</i>	<i>no. (%)</i>	<i>total no. (% smokers)</i>	
Unaffected	86 (52.8)	53 (31.5)	139 (38.1)	1.00
Mildly affected	28 (17.2)	30 (17.9)	58 (51.7)	1.74
Severely affected	49 (30.1)	85 (50.6)	134 (63.4)	2.81
Total	163 (100)	168 (100)	331 †

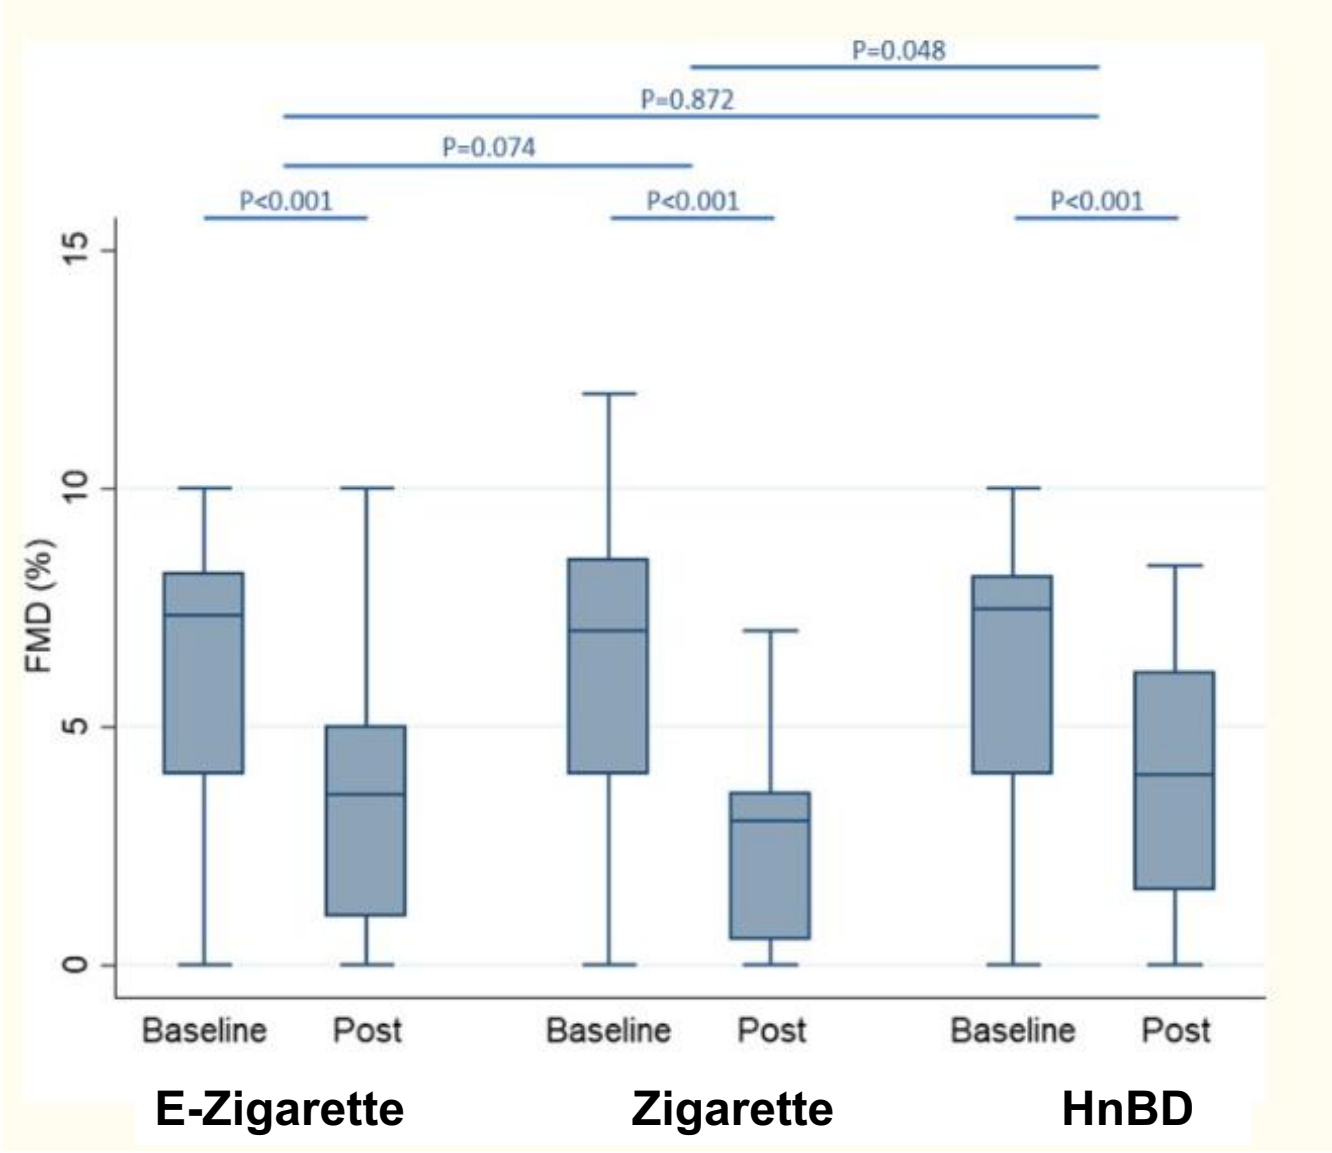

FIGURE 2 Endothelial Activation, Inflammation, and Thrombosis in COVID-19

Möglichen Zusammenhang zwischen Tabak/Nikotin und Covid19 Infektion

Tobacco smoking is recognized to increase the susceptibility to infections in a multifactorial way, including the alteration of the host's mechanical (mucociliary) and immunological defenses and the likely increased virulence of virus and bacteria. In addition, tobacco smoking has a significant impact on the immune system and activates inflammation; moreover the smoke-related structural and immunological alterations found in chronic bronchitis, COPD and emphysema patients represent ideal attachment areas for bacterial and viral infections.

Cattaruzza M et al, Acta Biomed 2020; Vol. 91, N. 2: 106-112

Patienten mit COPD und Raucher haben mehr ACE-2 Rezeptoren als Nichtraucher

Nicotine upregulates ACE2, which is suggested as a potential mechanism to increase susceptibility and severity of COVID-19

Patienten mit COPD und Raucher haben mehr ACE-2 Rezeptoren als Nichtraucher

Smoking and COVID-19 Disease Progression

Risiko für einen schweren Verlauf bei Covid19 Infekt

I. Personen ab 65 Jahren

II. Schwangere Frauen

III. Erwachsene mit folgenden Vorerkrankungen:

1. Bluthochdruck

- Arterielle Hypertonie mit Endorganschaden
- Therapie-resistente arterielle Hypertonie

2. Herz-Kreislauf-Erkrankungen

2.1 Generelle Kriterien

- Patient/innen mit Dyspnoe funktionelle Klasse NYHA II–IV und NT-Pro BNP > 125 pg/ml
- Patient/innen mit mindestens 2 kardiovaskulären Risikofaktoren (einer davon Diabetes oder arterielle Hypertonie)
- Vorgängiger Schlaganfall und/oder symptomatische Vaskulopathie
- Chronische Niereninsuffizienz (Stadium 3, GFR <60ml/min)

2.2 Andere Kriterien

2.2.1 Koronare Herzkrankheit

- Myokardinfarkt (STEMI und NSTEMI) in den letzten 12 Monaten
- Symptomatisches chronisches Koronarsyndrom trotz medizinischer Therapie (unabhängig von allfälliger vorheriger Revaskularisierung)

2.2.2 Erkrankung der Herzklappen

- Mittelschwere oder schwere Stenose und/oder Regurgitation zusätzlich zu mindestens einem generellen Kriterium
- Jeglicher chirurgischer oder perkutaner Klappenersatz zusätzlich zu mindestens einem generellen Kriterium

2.2.3 Herzinsuffizienz

- Patient/innen mit Dyspnoe funktionelle Klasse NYHA II–IV oder NT-Pro BNP > 125pg/ml trotz medizinischer Therapie jeglicher LVEF (HFpEF, HFmrEF, HFrEF)
- Kardiomyopathie jeglicher Ursache
- Pulmonalarterielle Hypertonie

Covid19 und Tabakkonsum

»It is possible that the period of self-isolation and lockdown restrictions during this pandemic could be used by some as an opportunity to quit smoking, but realistically only a minority of people will achieve cessation.

For the majority, the increased stress of a potentially fatal disease, possibility of loss of employment, feelings of insecurity, confinement, and boredom, could increase the desire to smoke.

During the financial collapse of 2008, tobacco shares were one of the only shares to increase.»

van Zyl-Smit R et al, Lancet Respiratory 2020

TAKE HOME MESSAGES

Tabak/Nikotin Konsum sind Risikofaktoren für Infekt, ob das auch für Covid19 wahr ist, ist nicht klar
Es gibt aber keine Daten dass Rauchen einen Schutzfaktor ist.

Tabak/Nikotin Konsumenten haben häufiger schweren Verläufe bei Covid19-Infekt

In eine Ausnahme-Situationen ist für viele Personen schwieriger ein Entwöhnung wahrzunehmen.
Desto wichtig ist die Tabak/Nikotin Konsumenten zu helfen!

Vielen Dank für die Aufmerksamkeit!
